Long term evaporation stability of sealant glasses

Geasee, P; Conradt, R

RWTH Aachen, D

75. Glastechnische Tagung, Kurzreferate (Poster-Beitraege), Wernigerode, D,
21.-23. Mai, 20012001

Document type: Conference paper Language: English

Record type: Abstract

ABSTRACT:

The evaporation of different glass compositions, namely (Mg,Ca,Ba)O-Al2O3-B2O3 (6.38 weight-%)-SiO2, (Mg,Ba)O-B2O3 (24.84 weight-%)-SiO2, and (Ca,Ba)O-Al2O3-SiO2 was investigated by the transpiration method (flow of 4 l/h) in a horizontal tube furnace, and by a high resolution thermal balance. The atmosphere applied was 833 mbar N2, 93 mbar H2 and 74 mbar H2O. The temperature was 800 deg C. This is a specific situation where the initially glassy systems are converted into a partially crystallized state. The exposure time was 2000 h. As expected, a high initial evaporation loss were observed with the B2O3 containing system. However, after 5000 h, a constant rate of 2.7 micrometer/(cm(exp 2)h) was assumed. The magnesia containing aluminosilicate system showed a very low loss of 0.96 micrometer/(cm(exp 2).h), while the magnesia free system displayed an initial mass increase followed by a low loss rate of 0.05 micrometer/(cm(exp 2).h).

Seventy-two intact, caries free human premolars and molars were divided into six test groups of 12 teeth each. All teeth were cleaned with a flour of pumice prophylaxis followed by etching for 60 seconds with 37% H3PO4, rinsing for 30 seconds and drying with oil-free air. Five commercial, light-cured fissure sealants and an unfilled version of one sealant were applied following manufacturers' instructions.

Teeth were thermal cycled for 5000 cycles from 5-50 degrees C with a one-minute dwell time at each temperature. Silver nitrate staining followed by mesiodistal sectioning was performed. Leakage and void formation were evaluated at X50 optical magnification.

Viscosity was assessed by syringing the fissure **sealants** into short pipettes, allowing free flow for 30 seconds and then light curing for one minute. The length of unfilled capillary was measured with a Vernier gauge.

All experimental data was subjected to a one-way ANOVA, and where differences were detected, they were identified by a post hoc Tukey hsd test at a priori alpha = 0.05.

Based on the conditions of the study, viscosity and now characteristics had no effect on sealing ability or void formation. Identifiers--KeyWord Plus(R): LEAKAGE; PIT; RETENTION; INVITRO Cited References:

Philadelphia, Pa., Amer. Soc. for Test. & Mater., May 9, 1969 Reapproved 1976, 3pp. (Amer. Nat. Standard ANSI/ASTM C639-69)., 1976

DOCUMENT AVAILABLE: YES RECORD TYPE: ABSTRACT LANGUAGES: English

This method describes a laboratory procedure for the determination of rheological (flow) properties of single- and multicomponent chemically curing sealants for use in building construction. Other suitable flow characteristics may be agreed upon by the seller and purchaser or specifier. Special nonsag properties and lower flow characteristics may be required for use in sloping joints where absolute leveling is not desired. (from Specification scope). (In: 1977 Annual book of ASTM Standards. Philadelphia, Pa., Amer. Soc. for Test . & Mater., 1977, Part 18, pp.350-352).

Abstract (Basic): US 5746963 A

An artificial ball-and-socket prosthesis comprises: (a) a viscous artificial cartilage (1) incorporating a fibre web mesh (4) encapsulated within an outer shell (2), and enclosing a ball (5) attached to a shaft (3), wherein (b) the preferred materials include cobalt-chromium-molybdenum (Co-Cr-Mo) alloy or titanium-aluminium-vanadium (Ti-6Al-4V) alloy in conjunction with an ultra-high molecular weight polyethylene acetabular bearing surface between the shell and femoral units, given that - (c) the pressure required to cause separation of the ball from the socket is determined by the difference between the diameter (A) of the opening of the shell and the diameter (B) of the ball, the encapsulation material, and the type, size, and pattern of the fibres used to control the cold flow characteristics of the viscous material (1). Also claimed are alternative applications of the principle of controlled cold flow characteristics, including a plastic bearing for a wheel.

USE - For forming an artificial ball-and-socket prosthesis.

ADVANTAGE - Enables the cold **flow characteristics** of a **viscous material** to be adjusted to meet specific requirements without

materially decreasing its normal function.

Searchtopic=A mass of solid or viscous material is placed between two plates. One of the plates is moved toward the other, compressing the material to a predetermined point at which some of the material extrudes from between the two plates. The mass of the extruded material is compared to the initial mass to determine flow characteristics of the material.
Claim 1: A method for determining the flow characteristics of a sealant material, wherein the test method comprises: applying an initial mass of sealant material as a sealant material layer between a surface of a flrst test specimen and a surface of a second test specimen to form a test specimen mssembly; providing pressure upon the test assembly so as to compress the sealant

Comments=

send=SEND

material between the first and second test specimens for a specific length of time, thereby extruding sealant material iom between the two test specimen slzrfaces;

calculating a tlow characteristic of the sealant material as the ratio of the mass of extruded sealant material to the initial mass of the sealant material layer.

determining the mass of sealant material extruded âom the test specimen

assembly after said length of time; and
